Evidently the fewer the parts, the smaller will be R, and the greater the precision. Also the longer the chain, the fewer will be the parts, and the greater the precision. It must be carefully noted, however, that the preceding reasoning only applies to the accidental errors (Art. 7) of observation, and that all constant errors must be investigated, and removed from the results, before the formulas (37) and (39) are used. The effects of temperature on the length of the chain or tape, for instance, may be removed by reading the thermometer, and applying the proper computed corrections, and the effects of side deviations may be removed by making the chain sufficiently longer at the start. In general, the constant errors of linear measurements increase directly as the length of the line; while only the accidental errors increase as the square root of the length. Angle Measurements. 94. The measurement of an angle is in general effected by taking the difference of readings from a graduated limb; and these readings, in their turn, may be the means of readings on two or more verniers. By the use of the principle expressed in formula (25) it is possible to determine the precision of these readings from the probable errors of observed results. As an example, the following measurements of an angle made with a transit having two verniers reading to minutes will be discussed. The angle was chosen at about 35 in order...
